

### Top in Protection

Weather conditions are the leading cause of winter service calls.

When ice accumulates on the ventilator, it can disrupt the blades' balance, generating vibrations that increase noise levels and cause the entire unit to shake. Mechanical components and vibrations are never a good combination.

Moreover, an excessive build-up of ice and snow in your heating and air-conditioning system can quite simply cause a breakdown. At best, you should turn off your system, melt the ice, then restart it. At worst, you have to place service call, with all it entails.

With InnoTop™, you'll avoid these problems and allow your heating and air-conditioning system to operate at the peak of efficiency under all conditions.

### Top in Rust Protection

When your heating and air-conditioning system's ventilator is in operation, particles consisting of tiny debris and ice are propelled at high speed onto your unit's interior components. This can lead to micro cracks that, with time, will allow rust to take hold. With InnoTop, you can prevent the appearance of rust that threatens the integrity of the components and leads to the unit's premature wear.

InnoTop™ is a trademark of InnoPro.

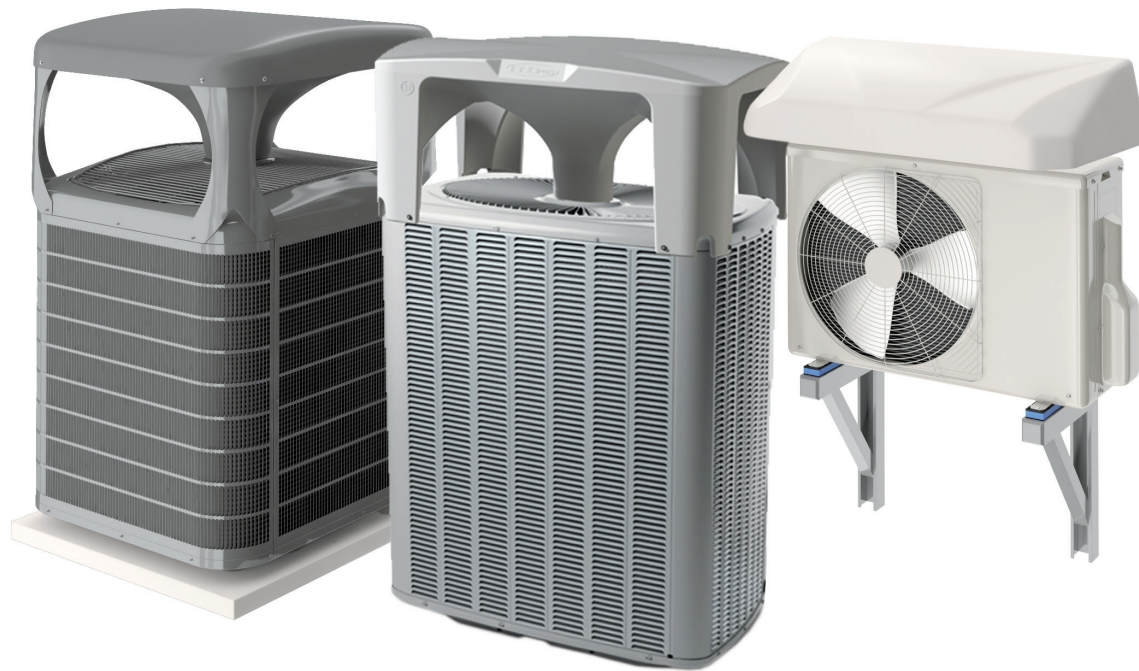

### Top in Flexibility

InnoTop adapts to a large number of units and sizes. It can be easily installed on most models.

We also offer a wall protector, which adapts to a wide range of bi-bloc wall units providing heating and air conditioning.

For details of the InnoTop product offering, we invite you to see the guide available on our website.

For details of the InnoTop product offering, see the guide available on our website.

### Top in Durability

InnoTop protectors are designed to withstand heavy loads and all types of inclement weather. They are produced from high-durability rotomoulded polymer that keeps its shape and withstands discoloration. They are also secured using a solid attachment system that will not fail over time due to loads or vibrations to which the unit is subjected. You will most likely never have to change your InnoTop protector as long as you own your heating and air-conditioning system.

### Top in Savings

Use of an InnoTop protector will increase the performance and service life of your heating and air-conditioning system while reducing service calls, all of which can help significantly cut costs related to your unit's operation. Better yet, the price of an InnoTop protector is but a fraction of these costs.

### Top in Efficiency

To protect a state-of-the-art unit such as a heating and air-conditioning system, installing just any component over it is not enough. It is important for its design to allow air to flow freely. InnoTop protectors are designed to direct air towards the exterior of the unit, preventing air returns that can reduce its energy efficiency.

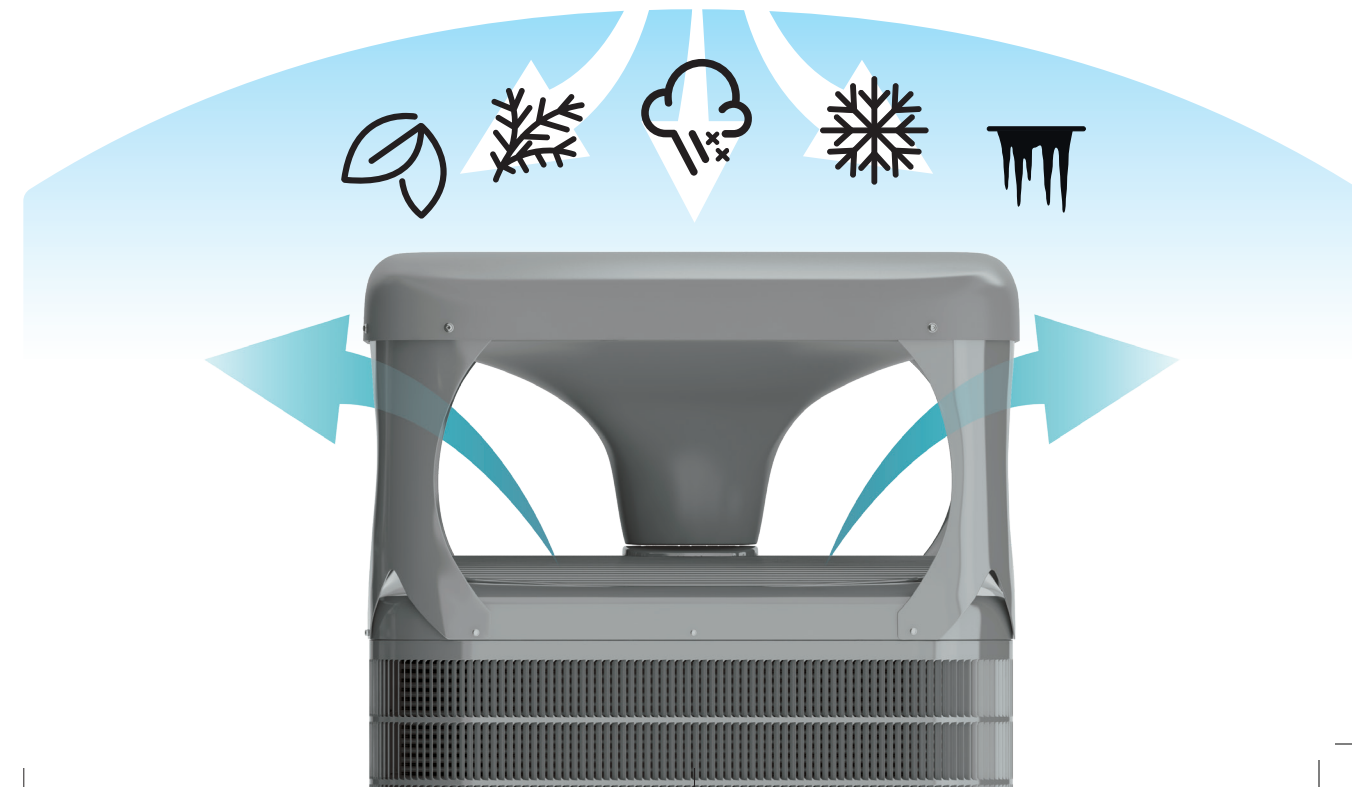

### Top in Aesthetics

When it comes to aesthetics, InnoTop protectors are in a class of their own. Distinguished by their painstaking fabrication and elegant yet discrete looks, they are available in four colours harmonizing with most heating and air-conditioning systems: grey, dark grey, clay and pearl.

Grey      Dark grey      Clay      Pearl

Colours are presented for illustrative purposes only.

# INNPRO

The protection pros

InnoPro is a firm dedicated to ongoing innovation in the design and production of professional-quality protective components for heating and air-conditioning systems. Their work seeks to ensure the optimal operation of units while increasing their service life.

Top in Protection

Cold, snow, ice, bad weather, microparticles: all of these can damage your heating and air-conditioning system. **Protect it** and reduce service calls while increasing the service life of your unit.

**Quite simply, a protected heating and air-conditioning system lasts longer!**
